

Arthroscopy for Osteoarthritis of the Knee

Clinical Coverage Criteria

Overview

Osteoarthritis is a disease of the articular cartilage. The exact cause of osteoarthritis is unknown however if a joint is burdened by improper alignment, excessive weight, excessive activity, overuse, or injury articular cartilage wears away. When cartilage loss occurs there may ultimately come to be bone on bone contact. Changes in structures around the joint (muscles and tendons), fluid accumulation and bony overgrowth (e.g., osteophytes or bone spurs) can develop. Articular cartilage has limited potential for regeneration or repair. There is no cure for osteoarthritis.

Osteoarthritis can affect any synovial joint. When it involves the knee joint it can cause severe chronic pain, loss of mobility, and disability. Treatment is focused on education, physical and occupational therapy, weight transfer modalities, joint protection and pharmacologic therapy. Patients with severe symptomatic osteoarthritis and limitation in activities of daily living should be referred to an orthopedic surgeon for evaluation. Knee joint replacement (knee arthroplasty) provides marked pain relief and functional improvement in the majority of patients with osteoarthritis of the knee. Prosthetic implants have a limited life expectancy depending upon an individual's age, weight, activity level and medical condition. Revision arthroplasty is difficult and outcomes of revision arthroplasty are not comparable to outcomes for primary arthroplasty.

Arthroscopy is a minimally invasive procedure that allows direct visualization of the interior of a joint. Knee arthroscopy allows orthopedic surgeons to assess - and in some cases, treat - a range of conditions affecting the knee joint. Reconstruction of the anterior cruciate ligament (ACL) and repair of a torn meniscus are among the most commonly performed arthroscopic surgeries. Injuries to both the ACL and the menisci are common, particularly in young athletes. (Torn menisci are also seen in older patients as the result of degeneration.) Arthroscopic lavage and arthroscopic debridement have been proposed as options for patients with osteoarthritis of the knee to reduce pain and improve function, postponing knee joint replacement.

1. Arthroscopic lavage or "washout" consists of flushing the knee joint with up to 10 liters of fluid. Any intraarticular debris is washed out through arthroscopic cannulas. In contrast to arthroscopic debridement, no instruments are used to mechanically debride or remove intraarticular tissue.
2. Arthroscopic debridement may include low volume lavage. Debridement is a general term which is used to cover many arthroscopic procedures including partial synovectomy, decompression and resection of plicae/adipose tissue, partial meniscectomy, chondroplasty, removal of loose bodies, and/or osteophyte removal.

Hundreds of thousands of arthroscopic procedures for osteoarthritis of the knee are performed annually however until recently quality scientific evidence regarding arthroscopic lavage and arthroscopic debridement for osteoarthritis of the knee was lacking. The evidence must demonstrate that the procedure reduces pain or improves function as compared with treatment provided to a control group.

Fallon Health's Technology Assessment Committee has concluded that the scientific evidence has not shown that arthroscopy improves outcomes for patients with osteoarthritis of the knee. Randomized controlled studies demonstrating a clinically significant advantage for arthroscopy

would be necessary to refute these results, which show equivalence between arthroscopy a control group.

Policy

Fallon Health does not cover arthroscopy for the treatment of osteoarthritis of the knee because this procedure has not been shown to improve patient outcomes, specifically reduction in knee pain or improvement of knee function when compared to a control group..

Exclusions

- Fallon Health excludes arthroscopy to treat the diagnosis of osteoarthritis of the knee.

Codes

This policy is not intended to address arthroscopy for other medically necessary indications, such as in the presence of infection, for the removal of loose or foreign bodies, or for the repair of a symptomatic torn ACL and/or meniscus. Claims for arthroscopy of the knee (CPT Codes 29870-29887 or 29999) submitted with osteoarthritis (ICD-9-CM 715.xx) or corresponding ICD-10-CM codes listed below as the primary diagnosis will be denied with the following disposition: Deny Vendor Liable.

Not all services mentioned in this policy are covered for all products or employer groups. Coverage is based upon the terms of a member's particular benefit plan which may contain its own specific provisions for coverage and exclusions regardless of medical necessity. Please consult the product's Evidence of Coverage for exclusions or other benefit limitations applicable to this service or supply. If there is any discrepancy between this policy and a member's benefit plan, the provisions of the benefit plan will govern. However, applicable state mandates take precedence with respect to fully-insured plans and self-funded non-ERISA (e.g., government, school boards, church) plans. Unless otherwise specifically excluded, federal mandates will apply to all plans. For Medicare and Medicaid members, this policy will apply unless Medicare and Medicaid policies extend coverage beyond this policy.
